

# Water Analysis Service

## Bringing you The Complete Solution

Penguin Spas provides a Microbiological Water Analysis Service in accordance with current HSE guidelines. It is a minimum requirement that a UKAS accredited laboratory performs a monthly bacteriological test and a quarterly test for legionella when pool and spa water is made available to the public. This includes hot tubs used as part of a holiday let and hot tubs on display.

For more information, please refer to the following publications:

- HSG282 - Control of legionella and other infectious agents in spa pool system ([click here](#))
- L8 - The control of legionella bacteria in water systems ([click here](#))

## Microbiological Testing of Spa & Pool Water

Microbiological samples for indicator organisms should be taken once a month as routine and quarterly for Legionella. More frequent sampling may be required depending on the risk assessment.

The dutyholders, including employers and those who manage and/or operate spa-pool systems, have the responsibility at ensuring that microbiological samples taken at the appropriate intervals and the results recorded in the spa log book together with any remedial actions taken.
